

Reward-optimal window sweep (L_{opt} , not L_{max}): $\alpha = 0.06$, $\sigma = 0.06$, $M = 4$; seeds 9001-9016 ($n = 16$). Linear-regime fit: $\Gamma = 0.29$. Error bars: bootstrap 95\% CI. Non-linear points excluded from fit.

Shared-arm reward vs. L

L_{opt} vs. T_{corr}

$\Gamma(\omega) = \omega dt \cdot L_{\text{opt}}(\omega)$
